

System Variable - _ashost

This is an example of using system variable “_ashost”. This system variable specifies the actual server name of the given SAP server. Operations can be performed based on a particular system name. this is particularly useful when users are connecting to multiple SAP ERP systems.

In the following example, based on the server name we navigate to different transactions using a single function.

Liquid UI Code:

```
//////////////////// 'SAPLSMTR_NAVIGATION.E0100.sjs' //////////////////////
```

```
println("Name of the server in use is "+_ashost);
```

```
del("X[IMAGE_CONTAINER]");
```

```
if(_ashost == "juneau"){
```

```
    set("V[z_tran]","/nVA01");
```

```
}
```

```
else if(_ashost == "ZEUS"){
```

```
    set("V[z_tran]","/nMM01");
```

```
}
```

```
onUIEvents['enter']=z_navigate;
```

```
//on enter navigates to “VA01” if server is Juneau and to “MM01” if server is zues
```

```
function z_navigate(){
```

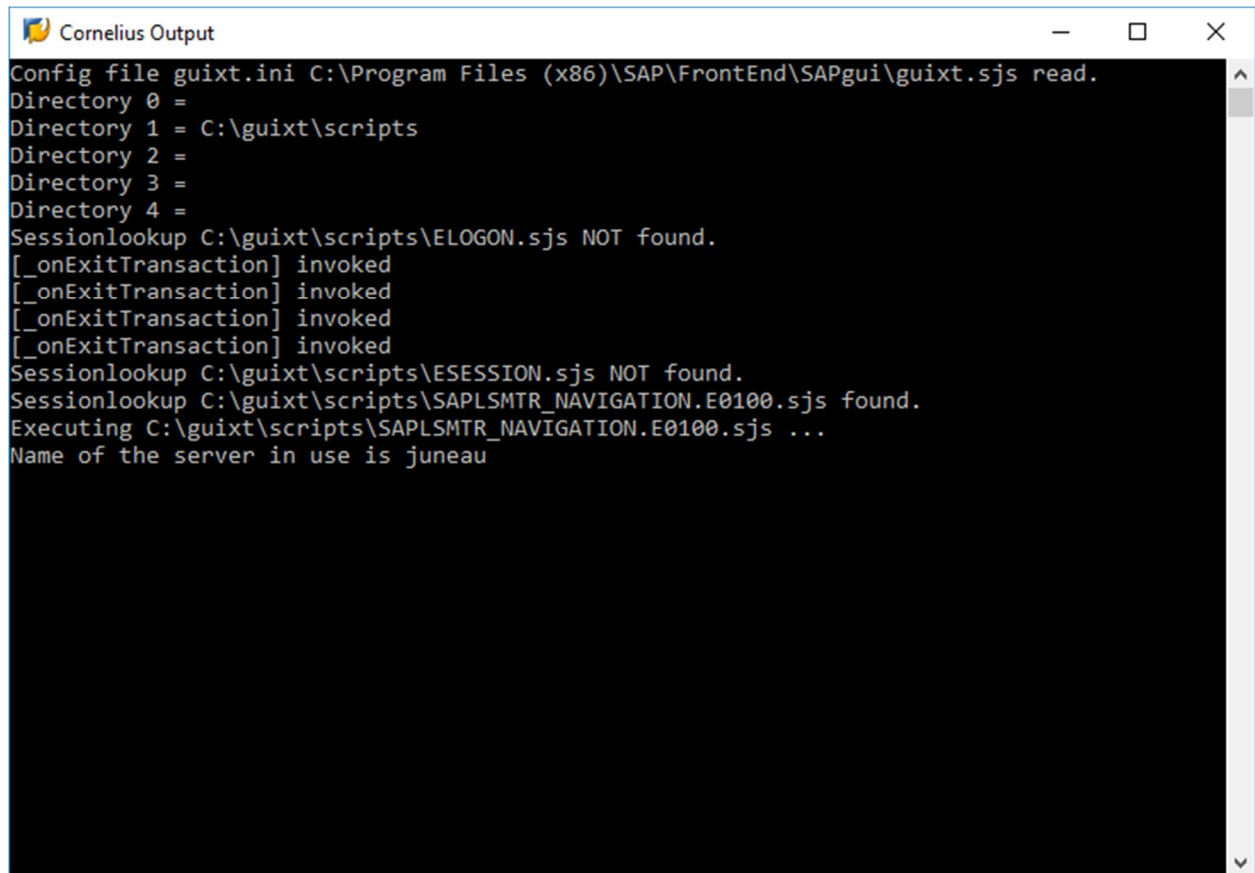

```
    // SAP Easy Access
```

```
    onscreen 'SAPLSMTR_NAVIGATION.0100'
```

```
        enter("&V[z_tran]");
```

```
}
```

Println statement with _ashost value on Cornelius output window

A screenshot of a Windows application window titled "Cornelius Output". The window has a standard Windows title bar with minimize, maximize, and close buttons. The main content area is a black rectangle with white text, displaying a series of log messages. The messages include file paths, directory listings, session lookup results, and transaction execution details. The text is as follows:

```
Config file guixt.ini C:\Program Files (x86)\SAP\FrontEnd\SAPgui\guixt.sjs read.  
Directory 0 =  
Directory 1 = C:\guixt\scripts  
Directory 2 =  
Directory 3 =  
Directory 4 =  
Sessionlookup C:\guixt\scripts\ELOGON.sjs NOT found.  
[_onExitTransaction] invoked  
[_onExitTransaction] invoked  
[_onExitTransaction] invoked  
[_onExitTransaction] invoked  
Sessionlookup C:\guixt\scripts\ESESSION.sjs NOT found.  
Sessionlookup C:\guixt\scripts\SAPLSMTR_NAVIGATION.E0100.sjs found.  
Executing C:\guixt\scripts\SAPLSMTR_NAVIGATION.E0100.sjs ...  
Name of the server in use is juneau
```
